## Why Choose DSL?

- ✓ Lifetime technical support
- ✓ Fully customisable products
- ✓ Product branding (bezel colours + company logos)
- ✓ Free pre-installation of OS and your software

## Our Services

- ✓ Electronic Design
- ✓ Production Management
- ✓ Assembly and test
- ✓ Bespoke BIOS creation

**2.5" SATA II Solid State Disk**

## Description

Transcend's 2.5" SATA II Solid State Disk comes in two different thicknesses (7mm or 9.5mm in height and both fit the standard dimensions of 2.5" SATA Hard Disk Drives), huge capacity, high speed, and low power consumption, it is the perfect storage device for PCs, Laptops, gaming systems, and handheld devices.

- Fully compatible with devices and OS that support the SATA II 3.0Gb/s standard
- Non-volatile Flash Memory for outstanding data retention
- Support Trim and NCQ command

## Features

- ROHS compliant
- Advanced Global Wear-Leveling and Block management for reliability
- Built-in ECC (Error Correction Code) functionality
- With DRAM Cache
- Advanced Garbage Collection
- Advanced Power Shield
- Support Security Command
- Support Enhanced S.M.A.R.T. function
- Hardware Purge and Write Protect
- Optional, support Transcend's SSD Scope Pro

## General Dimensions

### Ultra-Slim Model

Side	Millimeters	Inches
A	99.80 ± 0.25	3.929 ± 0.010
B	69.80 ± 0.25	2.748 ± 0.010
C	7.00 - 0.30	0.276 - 0.012

### Standard Model

Side	Millimeters	Inches
A	100.30 ± 0.25	3.949 ± 0.010
B	69.85 ± 0.25	2.750 ± 0.010
C	9.50 ± 0.15	0.374 ± 0.006

## Features

- **Global Wear Leveling – Advanced algorithm to enhance the Wear-Leveling Efficiency**

There are 3 main processes in global wear leveling approaches:

- (1) Record the block erase count and save in the wear-leveling table.
- (2) Find the static-block and save it in wear-leveling pointer.
- (3) Check the erase count when the block popped from spare pool. If the block erase count is larger than WEARCNT, then swap the static-block and over-count-block. After actual test, global wear leveling successfully even the erase count of every block; hence, it may extend the life expectancy of the SSD.

- **ECC Algorithm**

The controller uses BCH40 ECC algorithm per 1024 bytes depending on the structure of the flash. BCH40 may correct up to 40 random error bits within 1024 data bytes. With the help of BCH40 ECC, the endurance of Transcend SSD is greatly improved.

- **Bad Block Management**

When the flash encounters ECC failed, program fail or erase fail, the controller will mark the block as bad block. This will prevent the usage of bad blocks which may result in data loss in the future.

- **Advanced Garbage Collection**

Transcend SSD has perfect garbage collection mechanism to improve the performance of SSD. Advanced Garbage collection can efficiently manage data memory which allows the SSD to always maintain a stable performance. With Transcend's advanced flash management, the drive will be able to maintain high transfer speed even after long period of usage.

- **Enhanced S.M.A.R.T. function**

Transcend SSD supports S.M.A.R.T. command (Self-Monitoring, Analysis, and Reporting Technology) that allows the user to read the health information of the SSD. Transcend also defines some innovated S.M.A.R.T. features which allows the user to evaluate the status of the SSD in a much more efficient way.

**2.5" SATA II Solid State Disk**

---

- **Advanced Power Shield**

The controller uses intelligent internal power shield circuit to prevent SSD from damage when sudden power off or during power failure. The internal power detection mechanism of the SSD can monitor the power provided by the host. When sudden power loss occurs, the SSD will execute advanced power shield mechanism to protect data in the SSD.

- **Hardware Purge and Write Protect**

The SSD has built in hardware trigger for quick data erase and write protect of user data area. These features may be enabled by simply connecting a switch to the designated pins.

- **StaticDataRefresh Technology**

Normally, ECC engine corrections are taken place without affecting the host normal operations. As time passes by, the number of error bits accumulated in the read transaction exceeds the correcting capability of the ECC engine, resulting in corrupted data being sent to the host. To prevent this, the controller monitors the error bit levels at each read operation; when it reaches the preset threshold value, the controller automatically performs data refresh to “restore” the correct charge levels in the cell. This implementation practically restores the data to its original, error-free state, and hence, lengthening the life of the data.

- **EarlyRetirement Technology**

The StaticDataRefresh feature functions well when the cells in a block are still healthy. As the block ages over time, it cannot reliably store charge anymore and EarlyRetirement enters the scene. EarlyRetirement works by moving the static data to another block (a healthy block) before the previously used block becomes completely incapable of holding charges for data. When the charge loss error level exceeds another threshold value (higher from that for StaticDataRefresh), the controller automatically moves its data to another block. In addition, the original block is then marked as a bad block, which prevent it from further usage and make the block enters the state of “EarlyRetirement.” Note that, through this process, the incorrect data are detected and effectively corrected by the ECC engine, thus the data in the new block is stored error-free.

416	F	Reserved
417	F	Program/write the strong page only
418-419	V	Number of spare block
420-423	V	Average Erase Count
424-510	X	Vendor specific
511	V	Data structure checksum

F=the content of the byte is fixed and does not change.  
V=the content of the byte is variable and may change depending on the state of the device or the commands executed by the device.  
X=the content of the byte is vendor specific and may be fixed or variable.  
R=the content of the byte is reserved and shall be zero.  
\* 4 Byte value : [MSB] [2] [1] [LSB]

## SMART Attributes

The following table defines the vendor specific data in byte 2 to 361 of the 512-byte SMART data

Attribute ID (hex)	Raw Attribute Value						Attribute Name
	MSB					LSB	
01	MSB	00	00	00	00	00	Read Error Rate
05	LSB	MSB	00	00	00	00	Number of run time bad blocks
09	LSB	-	-	MSB	00	00	Power-On Hours
0C	LSB	MSB	00	00	00	00	Power Cycle Count
C0	LSB	MSB	00	00	00	00	Unexpected Power-off Count
C3	LSB	-	-	MSB	00	00	Hardware ECC recoveries
C4	LSB	-	-	MSB	00	00	Reallocation Event Count
C7	LSB	MSB	00	00	00	00	UltraDMA CRC Error Count
F1	LSB	-	-	MSB	00	00	Total LBA Write Counts (1 Count=32MByte)
F2	LSB	-	-	MSB	00	00	Total LBA Read Counts (1 Count=32MByte)
A0	LSB	-	-	MSB	00	00	Uncorrectable sectors during read/write operations
A1	LSB	MSB	00	00	00	00	Number of valid spare blocks
A3	LSB	MSB	00	00	00	00	Number of initial invalid blocks
A4	LSB	-	-	MSB	00	00	Total erase count
A5	LSB	-	-	MSB	00	00	Maximum erase count
A6	LSB	-	-	MSB	00	00	Minimum Erase count
A7	LSB	-	-	MSB	00	00	Average erase count

Note:

Example1: ID 0x01, only one byte is valid.

Example2: ID 0xA4, 4 bytes is valid.
